

ABSTRACT

There is provided a multi-terminal capacitor (21) capable of increasing an ESR without adding a separate part. First and second internal electrodes (30, 31) opposed to each other so as to form electrostatic capacitance have a capacitance generating portion (34, 37) functioning so as to form the electrostatic capacitance, terminal connecting portions (35) connected to the corresponding external terminal electrodes (32), and extended portions (36) connecting the capacitance generating portion (34, 37) to the terminal connecting portions (35). The extended portions (36) are narrower than the capacitance generating portion (34, 37) and the terminal connecting portion (35) and are curved in the direction of their thickness so as to provide a longer effective length.
